

LegalEase

Build Web Interface

Detailed Project Topic Document

Purpose: Build the Streamlit user interface described in the project documentation. The interface collects document type, parties, terms, effective date, optional jurisdiction/instructions, displays the generated draft, allows editing, and provides export controls.

The source documentation specifies Streamlit as the frontend and lists text inputs/text areas, a Generate Document button, editable output, styled preview, and TXT/DOCX/PDF download options.

filecite turn0file0L123-L141

Recommended screen structure

- Application title and short legal-draft disclaimer
- Sidebar/form for document type, parties, effective date and terms
- Generate button connected to the FastAPI backend
- Two-column generated-document editor and preview
- Download controls for TXT, DOCX and PDF

Core Streamlit implementation

```
import os
import requests
import streamlit as st
from dotenv import load_dotenv

load_dotenv()
BACKEND_URL = os.getenv("BACKEND_URL", "http://127.0.0.1:8000")

st.set_page_config(page_title="LegalEase", page_icon="⚖️", layout="wide")
st.title("⚖️ LegalEase")
st.caption("AI-assisted legal document drafting")

document_type = st.selectbox(
    "Document type",
    ["NDA", "Employment Contract", "Lease Agreement", "General Contract", "Custom"]
)
parties = st.text_area("Parties involved")
effective_date = st.date_input("Effective date")
terms = st.text_area("Terms & conditions", help="Separate terms with semicolons")

if st.button("Generate Document", type="primary"):
    payload = {
        "document_type": document_type,
        "parties": parties,
        "terms": [x.strip() for x in terms.split(";") if x.strip()],
        "effective_date": effective_date.isoformat(),
    }
    response = requests.post(f"{BACKEND_URL}/generate", json=payload, timeout=180)
    response.raise_for_status()
    st.session_state["content"] = response.json()["content"]

content = st.text_area(
    "Editable document",
    value=st.session_state.get("content", ""),
    height=600
)
```

The final interface should keep the API key out of the browser. Only the Streamlit server communicates with FastAPI; FastAPI communicates with Gemini.

Source basis: This topic is derived from the supplied LegalEase project documentation. Where the source did not provide implementation detail, this document presents the corresponding implementation structure used in the completed project.
