

LegalEase

Future Enhancements

Detailed Project Topic Document

Purpose: Document the next development steps suggested by the source material without changing the current MVP scope.

The project conclusion identifies future possibilities including deeper contract analysis, legal-database integration and personalized recommendations. It also highlights multilingual capabilities and document analysis as broader directions. ■filecite■turn0file0■L352-L369■

Enhancement roadmap

- Contract analysis: identify clauses, obligations, dates and risk indicators.
- Clause comparison: compare two versions and highlight changed language.
- Legal knowledge retrieval: connect approved legal/reference sources with clear citations.
- Multilingual drafting: allow input and output in supported regional languages.
- User accounts: save drafts and document versions securely.
- Template library: maintain reusable templates by document type.
- Audit trail: record document version and export events.
- Improved branding: company profiles, logos, fonts and reusable headers/footers.
- Async generation: background jobs for longer documents.
- Production deployment: HTTPS, secrets management, logging, monitoring and rate limits.

Important design principle

Future legal features should distinguish AI-generated drafting from verified legal information. Any legal database integration should identify the source, date and jurisdiction instead of presenting model-generated claims as authoritative.

Scalability direction

Source basis: This topic is derived from the supplied LegalEase project documentation. Where the source did not provide implementation detail, this document presents the corresponding implementation structure used in the completed project.
