

LegalEase

Select AI Model

Detailed Project Topic Document

Purpose: Explain the AI-model selection portion of the LegalEase design.

The original documentation selected Gemini 1.5 Pro and describes its intended use for structured legal-document generation, long context and formal drafting. ■filecite■turn0file0■L81-L111■

Project-level selection criteria

- Ability to follow structured prompts
- Strong long-form text generation
- Reliable preservation of user-supplied facts
- Consistent section organization
- Configurable output length
- Low enough latency for interactive drafting
- An API/SDK suitable for server-side integration

Prompt design

```
SYSTEM:
You are the drafting engine for LegalEase.
Do not invent missing facts.
Use [INSERT ...] placeholders.
Return only the document draft.

USER:
Document type: {document_type}
Parties: {parties}
Effective date: {effective_date}
Terms: {terms}
Jurisdiction: {jurisdiction}
Additional instructions: {additional_instructions}
```

Model configuration

```
from google import genai
from google.genai import types

client = genai.Client(api_key=api_key)

response = client.models.generate_content(
    model=model_name,
    contents=prompt,
    config=types.GenerateContentConfig(
        temperature=0.2,
        max_output_tokens=12000,
    ),
)
```

The model name is kept in .env so the application can be updated when Google's available models change. This is preferable to embedding a historical model identifier throughout the codebase.

Source basis: This topic is derived from the supplied LegalEase project documentation. Where the source did not provide implementation detail, this document presents the corresponding implementation structure used in the completed project.
